TIPLE OF INVENTION NUMBER: US/09/109,207C
CURRENT APPLICATION NUMBER: US/09/109,207C
CURRENT APPLICATION NUMBER: US/09/105,207C
PRIOR PLING DATE: 1999-07-03
PRIOR FILING DATE: 1997-07-03
NUMBER OF SEQ ID NOS: 44
SEQ ID NO 11
Sequence 12, Application US/08887352B
Patent No. 5994511
GENERAL INFORMATION:
APPLICANT: Henry B. Lowman, Leonard G. Presta, Paula M. Jardieu, John Lowe TITLE OF INVENTION: Improved Auti-IgE Antibodies and Method of TITLE OF INVENTION: Improving Polypeptides
NUMBER OF SEQUENCES: 26
CORRESPONDENCE ADDRESS:
ADDRESSEE: Genentech, Inc.
STREET: 1 DNA Way
CITY: South San Francisco
STATE: California

Sequence 2, Application US/09109207C

Patent No. 6172213

GENERAL INFORMATION:
APPLICANT: Henry B. Lowman, Leonard G. Presta, Paula M. Jardieu, John Lowe
TITLE OF INVENTION: Improved Anti-19E Antibodies and Method of Improving Polypeptide
FILE REPERENCE: P1123R1
CURRENT APPLICATION NUMBER: US/09/109,207C
CURRENT PILING DATE: 1998-06-30

PRIOR APPLICATION NUMBER: US 60/051,554
PRIOR FILING DATE: 1997-07-03
NUMBER OF SEQ ID NOS: 44

SEQ ID NO 2
LENGTH: 121
GENERAL INFORMATION:

APPLICANT: Henry B. Lowman, Leonard G. Presta, Paula M. Jardieu, John Lowe
TITLE OF INVENTION: Improved Anti-IgE Antibodies and Method of
TITLE OF INVENTION: Improving Polypeptides
NUMBER OF SEQUENCES: 26
CORRESPONDENCE ADDRESS:
ADDRESSER: Genentech, Inc.
STREET: 1 DAN WAY
CITY: South San Francisco
STATE: California
COUNTRY: USA
ZIP: 94080
COMPTER: BARDABLE FORM:
MEDIUM TYPE: 3.5 inch, 1.44 Mb floppy disk
COMPTER: The PC compatible
COMPTER: The PC compatible
COMPTER: Sylvent PC-DOS/MS-DOS

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

GENERAL INFORMATION:
APPLICANT: BALL, HOWARD A.
TITLE OF INVENTION: COMBINATION OF DEHYDROEPIANDROSTERONE OR
TITLE OF INVENTION: DEHYDROEPIANDROSTERONE SULPATE WITH AN ANTI-IGE
TITLE OF INVENTION: ANTIBODY FOR TREATMENT OF ASTHWA OR CHRONIC OBSTRUCTIVE
TITLE OF INVENTION: AUTHONARY DISEASE
TITLE REFERENCE: 30775-723.501
CURRENT APPLICATION NUMBER: US/10/923,327

(GETH) GENENTECH INC.

Simmons L;

WPI; 2004-562149/54.

Producing an antibody or antigen binding fragment in high yield in a cell culture, comprises expressing a variable domain with a modified framework region in a host cell.

Claim 13; SEQ ID NO 14; 161pp; English

The present invention describes a method for producing an antibody or antigen binding fragment in high yield in a cell culture. The method comprises expressing a variable domain of the antibody or antigen binding fragment comprising a modified framework region (FR) in a host cell, and recovering the antibody or antigen binding fragment variable domain comprising the modified framework from the host cell. The modified FR in the method described above has a substitution of at least one amino acid

```
with a corresponding HVR1 and/or HVR2 sequence of the variable domain.

The antibody or antigen binding fragment variable domain comprises the modified FR that has improved yield in cell culture compared to an unmodified antibody or antigen binding fragment. The antibody and antigen binding fragment. The antibody and antigen binding fragment The antibody and antigen binding fragment in antibody therapy. The immunomodulatory activities, and can be used in antibody therapy. The producing antibodies or antigen binding fragments in cell culture, in particular for improving the yield of recombinant antibodies or antigen binding fragment antibodies of the invention can be used to diagnose, treat, inhibit or prevent e.g. tumours and inflammatory, angiogenic and immunological disorders. The present caequence represents a heavy chain HVR1 peptide of an anti-VEGF (vascular endothelial cell growth factor) antibody, which is used in the exemplification of the present invention.
position with a different amino acid, where the different amino acid is the amino acid found at the corresponding FR position of a human subgroup variable domain consensus sequence that has a hypervariable region 1 (HVR1) and/or HVR2 amino acid sequence with the most sequence identity

The sequence is used in the course of the invention to produce the humanised anti-VBGF antibody of the invention. The humanised antibodies are used to inhibit VBGF-induced angiogenesis, particularly for treating or preventing tumours (of any type) and retinal disorders (e.g. age-related macular degeneration or diabetic retinopathy). They can also be used to treat other conditions that involve angiogenesis, e.g. rheumatoid arthritis, psoriasis, atherosclerosis, Grave's disease, etc

Humanised F(ab)-12 and affinity matured anti-vEGF antibodies may be used to treat conditions characterised by undesirable excessive necovascularisation. Such conditions include tumours (especially solid ones), rheumatoid arthritis, psoriasis, atheroscierosis, diabetes and other retinopathies, retrolental fibroplasia, age-related macular degeneration, neovascular glaucoma, haemangiomas, thyroid hyperplasia and chronic inflammation. Oedemas associated with tumours, strokes and head trauma, and ascites associated with malignancies, meig's syndrome, hung inflammation, nephrotic syndrome, pericardial effusion and pleural effusion, may also be treated. Monoclonal antibodies are generated in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            endothelial growth factor) antibodies or a variant of a parent anti-VEGF antibody, which binds human VEGF. The anti-VEGF antibodies are useful for inhibiting VEGF-induced angiogenesis in a mammal (particularly a human), particularly those having a tumour or a retinal disorder e.g. intraocular neovascular disorders. The present sequence is an exemplary heavy chain variable domain of the humanised anti-VEGF antibody of the invention

The present invention describes an antibody comprising a variant heavy chain hinge region incapable of inter-heavy chain disulfide linkage. Also described: (1) an antibody lacking inter-heavy chain disulfide linkage. Also described: (1) an inmunoconjugate comprising the antibody or immunoconjugate comprising the antibody or immunoconjugate, and carrier; (4) an article of manufacture comprising the composition in a container; (5) a polymucleotide encoding the antibody or immunoconjugate, or a variant immunoglobulin heavy chain carbibody or immunoconjugate, (6) a polymucleotide encoding the antibody or immunoconjugate; (7) a host cell comprising the recombinant vector; (8) expressing in a host cell and comprising the recombinant at least one inter-heavy chain disulfide linkage; (6) an ecombinant of comprising the recombinant at least one inter-heavy chain disulfide inhapped; (7) a host cell comprising the recombinant at least one inter-heavy chain disulfide inhapped; (10) an approsylated antibody produced by the method; and (10) treating, preventing, disagnosing, delaying or preventing, diagnosing, delaying or preventing a disease in a subject. The antibody has cytostatic and immunosuppressive activities, and can be useful for treating, preventing, diagnosing, diagnosing, delaying or preventing a disease, e.g. tumour, cancer or immunoconjugate and methods are useful for treating, preventing, diagnosing disease, e.g. tumour, cancer or immune disorder. The present sequence represents the anti-VEGF heavy chain from the expression cassette of the present the anti-VEGF heavy chain from the expression cassette of the present the anti-VEGF heavy chain from the expression cassette of the present the anti-VEGF heavy chain from the expression cassette of the present the anti-VEGF heavy chain from the expression cassette of the present the composition of the present the composition of the expression cassette.
                                                                                                                                                                                                                                                                                                                                          Plasmid pxVG11VNERK expression cassette heavy chain protein SEQ ID NO:12.
                                                                                                                                                                                                                                                                                                                                                                                                 antibody; variant heavy chain hinge region; immunoconjugate; cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antibody comprising a variant heavy chain hinge region incapable of inter-heavy chain disulfide linkage, useful for treating, preventing, diagnosing, delaying or preventing a disease, e.g. tumor, cancer or
                                                                                                                                                                                                                                                                                                                                                                                                                       immunosuppressive; immunotherapy; tumour; cancer; immune disorder;
expression cassette; plasmid pxVG1IVNERK; anti-VEGF heavy chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Example 1; SEQ ID NO 12; 124pp; English.
                                                                                                                                                                                     ADO14132 standard; protein; 479 AA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   30-OCT-2003; 2003WO-US034610.

The present invention describes a method for producing an antibody or antigen binding fragment in high yield in a cell culture. The method comprises expressing a variable domain of the antibody or antigen binding fragment comprising a modifield framework region (FR) in a host cell, and recovering the antibody or antigen binding fragment variable domain comprising the modified framework from the host cell. The modified FR in the method described above has a subsettution of at least one amino acid position with a different amino acid, where the different amino acid is the method described above has a subsettution of a human subgroup variable domain consensus sequence that has a hypervariable region 1 (HYR1) and/or HYR2 sequence with the most sequence identity with a corresponding HYR1 and/or HYR2 sequence of the variable domain.

The antibody or antigen binding fragment variable domain comparied to an cumodified antibody or antigen-binding fragment. The antibody and antigen binding fragment invention are useful for temnomodulatory activities, and can be used in antibody therapy. The methods and compositions of the present invention are useful for producing antibodies or antigen binding fragments in cell culture, in particular for improving the yield of recombinant antibodies or antigen binding fragments of the invention can be binding fragments of antigen binding fragments and can be used in antibodies or antigen binding fragments and can be used in antibodies or antigen binding fragments and can be used in antibodies or antigen binding fragments and can be used in antibodies or antigen binding fragments and can be used in antibodies or antigen binding fragments and can be also and composition of the present invention and antigen binding fragments in cell culture. The antibodies or antigen binding fragments and antigen binding fragments and antigen binding fragments and antigen binding fra ö Producing an antibody or antigen binding fragment in high yield in a cell culture, comprises expressing a variable domain with a modified framework region in a host cell. antibody; antigen binding fragment; cell culture; variable domain; modified framework region; hypervariable region; cytostatic; antiinflammatory; antiangiogenic; immunomodulatory; antibody therapy; tumour; inflammatory disorder; anglogenic disorder; immunological disorder; anti-VEGF antibody; anti vascular endothelial cell growth factor antibody; heavy chain. The present invention describes a method for producing an antibody or antigen binding fragment in high yield in a cell culture. The method comprises expressing a variable domain of the antibody or antigen binding fragment comprises expressing a modified framework region (FR) in a host cell, and recovering the antibody or antigen binding fragment variable domain comprising the antibody or antigen binding fragment variable domain comprising the antiferent amino acid, where the different amino acid is comprising the addition with a different amino acid, where the different amino acid is cost tion with a different amino acid, where the different amino acid is cost and found at the corresponding FR position of a human subgroup variable domain consensus sequence that has a hypervariable region 1 (HYR1) and/or HYR2 amino acid sequence with the most sequence identity ith a corresponding HYR1 and/or HYR2 sequence of the variable domain.

The antibody or antigen binding fragment variable domain comprises the modified FR that has improved yield in cell culture compared to an entigen antibody or antigen-binding fragment. The antibody and antigen
                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Producing an antibody or antigen binding fragment in high yield in a cell culture, comprises expressing a variable domain with a modified framework region in a host cell.
used to diagnose, treat, inhibit or prevent e.g. tumours and inflammatory, anglogenic and immunological disorders. The present sequence represents the heavy chain of an anti-VEGF (vascular endothelial cell growth factor) antibody, which is used in the exemplification of the

ö
binding fragment have cytostatic, antiinflammatory, antiangiogenic and immunomodulatory activities, and can be used in antibody therapy. The methods and compositions of the present invention are useful for producing antibodise or antigen binding fragments in cell culture, in particular for improving the yield of recombinant antibodies or antigen binding fragments in cell culture. The antibodies of the invention can be used to diagnose, treat, inhibit or prevent e.g. tumours and inflammatory, angiogenic and immunological disorders. The present sequence represents the heavy chain of an anti-VEGF (vascular endothelial cell growth factor) antibody, which is used in the exemplification of the

The method comprises expressing a variable domain of the antibody or antigen binding fragment comprising a modified framework region (FR) in a host cell, and recovering the antibody or antigen binding fragment variable domain comprising the modified framework from the host cell. The modified FR in the method described above has a substitution of at least one amino acid position with a different amino acid, where the different amino acid is the amino acid is the amino acid tound at the corresponding FR position of a human subgroup
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Producing an antibody or antigen binding fragment in high yield in a cell culture, comprises expressing a variable domain with a modified framework
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            modified framework region; hypervariable region; cytostatic; antiinflammatory; antianglogenic; immunomodulatory; antibody therapy; tumour; inflammatory; disorder; angiogenic disorder; immunological disorder; anti-VEGE antibody; anti vascular endothelial cell growth factor antibody; heavy chain.

(HYR1) and/or HYR2 amino acid sequence with the most sequence identity with a corresponding HYR1 and/or HYR2 sequence of the variable domain.

The antibody or antigen binding fragment variable domain comprises the modified FR that has improved yield in cell culture compared to an unaddified antibody or antigen-binding fragment. The antibody and antigen binding fragment bave cytostatic, antiinflammatory, antianglogenic and immunomodulatory activities, and can be used in antibody therapy. The methods and compositions of the present invention are useful for producing antibodies or antigen binding fragments in cell culture, in particular for improving the yield of recombinant antibodies or antigen binding fragments in cell culture. The antibodies of the invention can be used to diagnose, treat, inhibit or prevent e.g. tumours and cultiflammatory, angiogenic and immunological disorders. The present sequence represents the heavy chain of an anti-VEGF (vascular endothelial sequence represents the heavy chain of an anti-VEGF (vascular endothelial cell growth factor) antibody, which is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Producing an antibody or antigen binding fragment in high yield in a cell culture, comprises expressing a variable domain with a modified framework region in a host cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a method for producing an antibody or antigen binding fragment in high yield in a cell culture. The method comprises expressing a variable domain of the antibody or antigen binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       modified framework region; hypervariable region; cytostatic; antiinflammatory; antiangiogenic; immunomodilatory; antibody therapy; tumour; inflammatory; disorder; angiogenic disorder; immunological disorder; anti-vese antibody; antibody; antibody; anti-vese anti-ves
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

recovering the antibody or antigen binding fragment variable domain comprising the antibody or antigen binding fragment variable domain comprising the modified framework from the host cell. The modified FR in the method described above has a substitution of at least one amino acid position with a different amino acid, where the different amino acid is the amino acid found at the corresponding FR position of a human subgroup the amino acid found at the corresponding FR position of a human subgroup of the amino acid found at the corresponding FR position of a human subgroup (HVR1) and/or HVR2 sequence with the most sequence identity with a corresponding HVR1 and/or HVR2 sequence of the variable domain.

CHA antibody or antigen binding fragment variable domain.

CHA antibody or antigen binding fragment. The antibody and antigen modified R that has improved yield in cell culture compared to an unmodified antibody or antigen-binding fragment. The antibody and antigen handon fragment and antibody and antigen binding fragment and compositions of the present invention are useful for methods and compositions of the present invention are useful for producing antibodies or antigen binding fragments in cell culture. The antibodies of the invention can be used to diagnose, treat, inhibit or prevent e.g. tumours and composition of mamunological disorders. The present inflammatory, anglogenic and immunological disorders. The present sequence represents the heavy chain of an anti-VBGF (vascular endothelial sequence represents the heavy chain of an anti-VBGF (vascular endothelial sequence represents antibody, which is used in the exemplification of the

Claim 13; Fig 2A; 91pp; English.

disease.

The invention relates to a humanized, human or chimeric anti-CD74
antibody or its fragment. The naked anti-CD74 antibody or a naked
antibody fusion protein or fragment, or a therapeutic or diagnostic
conjugate comprising an anti-CD74 antibody is useful for diagnosting
treating a disorder or a disease that is a CD74 expressing malignancy
c (solid tumour, non-Hodgkin's lymphoma, Hodgkin's lymphoma, multiple
myeloma, another B-cell malignancy and a T-cell malignancy), an immune
dysregulation disease, an autoimmune disease, organ graft rejection, and
graft versus host disease. The solid tumour is melanoma, carcinoma and
c arcinoma, stomach carcinoma and melanoma. The B-cell malignancy is of
non-Hodgkin's lymphoma, is arenal carcinoma, intestinal
carcinoma, squessive forms of B-cell lymphomas, chronic lymphomas, aggressive forms of B-cell lymphomas, chronic lymphatic leukemias, acute lymphatic leukemias, and multiple myeloma. The present
sequence represents a chimeric anti-CD74 antibody LL1 (cLL1) heavy chain
veriable region

Goldenberg DM; g 2, Hansen H, Leung S,

2003-767381/72. N-PSDB; ACP57894. New humanized, human or chimeric anti-CD74 antibody or fragment, useful for diagnosing or treating a CD74 expressing malignancy, an immune dysregulation disease, an autoimmune disease or graft versus host disease

Claim 6; Fig 3A; 91pp; English.

The invention relates to a humanized, human or chimeric anti-CD74 antibody or its fragment. The naked anti-CD74 antibody or a naked antibody fusion protein or fragment, or a therapeutic or diagnostic conjugate comprising an anti-CD74 antibody is useful for diagnostic treating a disorder or a disease that is a CD74 expressing malignancy (solid tumour, non-Hodgkin's lymphoma, Hodgkin's lymphoma, multiple myeloma, another B-cell malignancy and a T-cell malignancy), an immune

```
ö
dysregulation disease, an autoimmune disease, organ graft rejection, and graft versus host disease. The solid tumour is melanoma, carcinoma and sarcoma. The carcinoma and carcinoma, lung carcinoma, intestinal carcinoma, stomach carcinoma and melanoma. The B-cell malignancy is of non-Hodgkin's lymphoma, Hodgkin's lymphoma, indolent forms of B-cell nymphomas, aggreesive forms of B-cell lymphomas, chronic lymphatic leukemias, and multiple myeloma. The present sequence represents a murine anti-CD74 antibody LL1 heavy chain variable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a humanised, human or chimeric anti-CD74 antibody or its fragment. The naked anti-CD74 antibody or a naked antibody or its fragment. The naked antibody or a naked antibody fusion protein or fragment, or a therapeutic or diagnostic conjugate comprising an anti-CD74 antibody is useful for diagnostic treating a disorder or a disease that is a CD74 expressing malignancy (solid tumour, non-Hodgkin's lymphoma, Hodgkin's lymphoma, multiple myeloma, another B-cell malignancy and a T-cell malignancy), an immune disease, another B-cell malignancy and a T-cell malignancy, an immune disease, organ graft rejection, and garft versus host disease. The solid tumour is melanoma, carcinoma and sarcoma. The carcinoma is a renal carcinoma. The B-cell malignancy is of non-Hodgkin's lymphoma, Hodgkin's lymphoma, Hodgkin's lymphoma, Hodgkin's lymphoma, intestinal lymphomas, chronic lymphatic leukemias, acute lymphatic leukemias, and multiple myeloma. polymeric carriers, and effectors.

Disclosure; SEQ ID NO 6; 44pp; English.

The invention describes a composition (I) comprising an immunoconjugate which has one or more anti-CD74 binding molecules conjugated to one or more lapids, polymeric carriers, micelles, manoparticles or their combinations, and one or more effectors. Also described are: preparing combinations, and one or more effectors. Also described are: preparing combinations, and one or more effectors. Also described are: preparing combinations, and one or more effectors are expensed and anti-CD744 antibody; and a kit comprising (I). (I) is useful for treating and/or antibody; and a kit comprising (I). (I) is useful for treating and/or cationing a disease or disorder such as a CD74-expressing andigease or disorder such as a CD74-expressing malignancy, immune dysregulation disease. The CD74-expressing malignancy is a lymphoma, multiple mysloma, and comparing and gloma. The CD74-expressing malignancy is a solid tumor, which is chosen from melanoma, carcinoma, serome and gloma. The carcinoma, stone from melanoma, prostate cancer, overian cancer, and melanoma. The CD74 expressing malignancy is a solid tumor, which is chosen from melanoma, prostate cancer, overian cancer, and melanoma. The CD74 expressing malignancy is a B-cell malignancy chosen from melanoma, prostate cancer, overian cancer, and melanoma. The CD74 expressing malignancy is a B-cell malignancy chosen from mile comprises LLI or its fragment. The composition further comprises one or more daruge produced in maint-CD30, anti-CD32, anti-CD33, anti-CD33, anti-CD32, anti-CD30, anti-CD33, anti-CD3
